Perimeter Lighting for Night Operations

Helicopter landing areas used at night require reliable perimeter lighting to ensure safe and precise operations. AirSea Technology provides a full range of perimeter lighting solutions, including both elevated and inset fixtures. Inset lights are available in semi-flush or full-flush designs for optimal integration with the landing surface.

For enhanced night vision capability, all perimeter lights can be supplied with infrared (IR) options, supporting NVG (Night Vision Goggle) navigation.

Lighting intensity can be adjusted in compliance with ICAO standards, offering three dimming levels:

- 100%
- 50%
- 30%

Inset lights can be mounted in a 5" seating, ensuring durability and precise alignment.

Perimeter lights can also be installed in an 8" seating pot using an adapter ring, which can optionally be supplied with integrated heating for reliable performance in cold climates.

TD/PM Circle-H lighting is becoming increasingly popular, especially at European hospitals, as it provides clear visual guidance for helicopter landing zones.

For flexible operations, we also offer a portable lighting system, specifically designed for use with ambulances. This system helps indicate safe landing areas for helicopters during emergency situations.

In addition, we supply work lights in the form of floodlights, ensuring optimal illumination for ground crews and support staff during night operations.
